SUMMARY

Frontend-led fullstack engineer with 5 years of experience and a co-founder credit. At GSG, top contributor by commit volume (~30%) on a 20-engineer team at a live EU logistics platform — 490+ commits, 200+ PRs — while also delivering backend services and CI/CD pipelines. At Skiper, sole frontend owner: migrated CRA to Vite (build time 52s → 3s), refactored a 280-file flat codebase into a 5-layer Feature-Sliced Design architecture, and built a 3-language i18n system. Stack spans React, TypeScript, TanStack Query, Java/Spring Boot, Node.js, and AWS.

SKILLS

Frontend: React, TypeScript, Next.js, Redux Toolkit, TanStack Query, Material UI, shadcn/ui, Vite, Feature-Sliced Design (FSD)

Backend: Java 17/21, Spring Boot, Spring Security, JPA/Hibernate, PostgreSQL, Node.js, Prisma

Infra & DevOps: Kubernetes, Docker, Helm, AWS (Secrets Manager, STS, OIDC), Jenkins, SonarQube, JaCoCo, Trivy, Micrometer, Prometheus

Languages: Georgian (native) · English (professional) · Russian (professional)

EXPERIENCE

Senior Software Engineer — Georgian Service Group

June 2021 - Present

EU e-commerce logistics platform for parcel routing optimization and truck line scheduling across Europe. Top contributor by commit volume (~30%) on a 20+ engineer team, working across frontend, backend microservices, and DevOps.

FRONTEND

- Top frontend contributor: 490+ commits, 160+ tasks delivered, 200+ pull requests across 4 years.
- Built multi-view planning and scheduling interfaces (daily/weekly/historical) with dynamic filtering, forecasting, and scenario comparison — core operational tools across the logistics platform.
- Established frontend data-layer patterns using Redux Toolkit and TanStack Query, standardizing data fetching, cache invalidation, and domain state across a 25+ engineer codebase.
- Built and maintained a shared component library (forms, tables, dialogs, filters) adopted across the team to eliminate duplicated UI code and enforce consistent patterns.
- Implemented frontend RBAC with permission-driven rendering, gating UI elements and routes based on user roles.
- Led CRA → Vite and Moment.js → Day.js migrations, modernizing the build toolchain and reducing bundle size.
- Introduced Vitest-based unit and integration testing; led large-scale legacy code removal reducing codebase surface and maintenance overhead.

BACKEND

- Designed and implemented REST APIs and domain services in Spring Boot, covering planning, scheduling, and data-processing workflows across distributed microservices.
- Built validation and rule engines enforcing data integrity and real-time operational constraints across distributed services.
- Bootstrapped a Spring Boot microservice from scratch: layered domain architecture, external API integrations, and secrets management via AWS Secrets Manager.
- Refactored batch-scheduled job workflows into on-demand REST APIs, eliminating timing dependencies and giving operators direct execution control.
- Implemented OIDC-based service-to-service authentication and integrated AWS Secrets Manager and STS for credential-free service configuration.
- Contributed 100+ commits across backend services, delivering 30+ production features.

DEVOPS & INFRASTRUCTURE

- Built and maintained CI/CD pipelines in Jenkins with integrated code quality gates (SonarQube) and container vulnerability scanning (Trivy).
- Managed Kubernetes deployments across dev and production clusters using Helm, including CronJob scheduling and per-environment service configuration.
- Hardened containerized services with non-root Docker images and Kubernetes security contexts.
- Instrumented services with Micrometer/Prometheus metrics and structured logging, enabling operational visibility across distributed deployments.

EXPERIENCE

Co-founder & Frontend Lead — Skiper Technologies GmbH

2022 - Present

One of three co-founders; sole owner of the entire frontend over 4+ years.

- Led frontend development from initial commit to production: 414 commits, ~108,000 net lines across 1,172 files as the sole frontend owner.
- Owned end-to-end delivery across 10+ product domains in a React + TypeScript + TanStack Query SPA, from initial architecture through iterative feature releases.
- Migrated from Create React App to Vite, reducing production build times from 52 seconds to 3 seconds (94% faster).
- Refactored a 280-file flat codebase to a 5-layer Feature-Sliced Design architecture with 16 feature slices and ESLint-enforced import boundaries; codebase scaled to 559 files with zero cross-layer violations.
- Designed and maintained a full i18n system across 3 languages, covering every product surface from authentication to core workflows.
- Introduced regression and integration test suites covering multi-tenant context, API payload contracts, and authentication flows.
